Quadruple low to high voltage translator with 3-state outputs

HEF4104B MSI

DESCRIPTION

The HEF4104B quadruple low voltage to high voltage translator with 3-state outputs provides the capability of interfacing low voltage circuits to high voltage circuits, such as low voltage LOCMOS and TTL to high voltage LOCMOS. It has four data inputs (I_0 to I_3), an active HIGH output enable input (EO), four data outputs (O_0 to O_3) and their complements (\bar{O}_0 to \bar{O}_3).

With EO HIGH, O_0 to O_3 and \bar{O}_0 to \bar{O}_3 are in the low impedance ON-state, either HIGH or LOW as determined by I_0 to I_3 ; with EO LOW, O_0 to O_3 and \bar{O}_0 to \bar{O}_3 are in the high impedance OFF-state.

The device uses a common negative supply (V_{SS}) and separate positive supplies for inputs (V_{DDI}) and outputs (V_{DDO}). V_{DDI} must always be less than or equal to V_{DDO} , even during power turn-on and turn-off. For the permissible operating range of V_{DDI} and V_{DDO} see graph Fig.4.

Each input protection circuit is terminated between V_{DDO} and V_{SS} . This allows the input signals to be driven from any potential between V_{DDO} and V_{SS} , without regard to current limiting. When driving from potentials greater than V_{DDO} or less than V_{SS} , the current at each input must be limited to 10 mA.
